

HOUSING AND ACTUATING APPARATUS AND METHODS
ASSOCIATED THEREWITH

Abstract of the Disclosure

5

A combination includes a product container having a longitudinal dimension and a valve oriented to discharge product generally longitudinally therefrom. Valve actuating apparatus extends laterally from the valve in a direction transverse to the longitudinal dimension and terminates at an outer peripheral surface. A housing has a wall that tapers
10 to a discharge opening, and the discharge opening has a size larger than a radius of the container but smaller than the greatest lateral extent of the valve actuating apparatus. The outer peripheral surface is disposed in interfering relationship with the wall when the container is disposed in the housing.
